Project Setup

🔥 **Hot Tips**

- Use `bundler` for dependency management
- Use a good IDE like RubyMine, VS Code, or Cursor
- Ruby 3.1+ recommended

Initialization

Create a new project with the CLI:

```bash
gem install tina4
tina4 init my-project
cd my-project
bundle install
tina4 start
```

- `gem install tina4` : Installs the Tina4 gem globally.
- `tina4 init my-project` : Creates project structure with folders (`routes/` , `templates/` , `public/` , `migrations/`) and starter files.
- `bundle install` : Installs dependencies from the generated `Gemfile` .
- `tina4 start` : Launches the development web server.

Project Structure

```
my-project/
├── app.rb              # Main entry point with routes
├── Gemfile             # Ruby dependencies
├── .env                # Environment variables
├── .gitignore
├── routes/             # Auto-discovered route files
├── templates/          # Twig template files
│   └── base.twig       # Base layout template
├── public/             # Static assets (CSS, JS, images)
│   ├── css/
│   ├── js/
│   └── images/
├── migrations/         # SQL migration files
├── src/                # Additional application code
└── logs/               # Auto-rotating log files
```

Default Webserver

Access the server at `http://localhost:7145` . Customize the listening address/port:

bash

```bash
# Custom port
tina4 start --port 8001

# All interfaces on port 8001
tina4 start --host 0.0.0.0 --port 8001

# Development mode with auto-reload
tina4 start --dev
```

CLI Commands

Command	Description
`tina4 init [name]`	Initialize a new project
`tina4 start`	Start the web server
`tina4 migrate`	Run pending migrations
`tina4 migrate --create name`	Create a new migration
`tina4 test`	Run inline tests
`tina4 routes`	List all registered routes
`tina4 console`	Start an interactive Ruby console
`tina4 version`	Show Tina4 version

Debugging

Debug level defaults to `ALL` for development. Set `TINA4_DEBUG_LEVEL=Info` in `.env` for production. Logs rotate automatically in the `logs/` directory.
